

*When our lease came up for renewal in 1993, I decided to build our own office instead. My background in architecture allowed me to quickly come up with a design for the interior space of a building which was already under construction. We soon moved into a 2-storey office with lots of space, a spiral staircase rising from the basement to the 2nd floor and a waterfall to provide much-needed humidity in winter.*

*Top — view of the entrance and reception area bathed in natural light.*

*Left — main entrance.*

*Right — view from the spiral staircase. In the background, the meeting room equipped with overhead VGA projector could be closed off behind sliding doors. The fortepiano I built as a hobby was used on a few occasions for musical performances in the large main floor area.*

*Part of the appeal of the interior is the curvilinear shape of the stairwell.*

*The main studio on the 2nd floor has a ceiling height of 13 feet. The flooring is maple laid in a herringbone pattern. Again, lots of light.*

*More viewpoints of the studio area and the kitchen. Overhead speakers provide background music. All desk units and cabinets were built to my specifications.*
